

PRÁCTICA 4 UD 1

Footprinting y Enumeración con DNS

Hecho por: Izan Navarro

izan navarro luján
IES SERRA PERENXISA

INDICE

1.PREPARACIÓN PREVIA:	2
2.FIERCE:	2
3.DNSRECON:	3
4.DNSENUM:	4
5.THEHARVESTER:	7
6. DNSDUMPSTER:	8
7. AMASS:	9
8.CANARY:	10

1.PREPARACIÓN PREVIA:

1) Guardo una copia de seguridad del archivo de resolución DNS:

```
(izan@kali)-[~/Desktop]
$ sudo cp /etc/resolv.conf /etc/resolv.conf.back
```

2) Apunta temporalmente el resolver de Kali al DNS de tu Ubuntu (ejemplo de la act. 10.10.10.20):

```
izan@kali: ~
Session Actions Edit View Help
GNU nano 8.6 /etc/resolv.conf
# Generated by NetworkManager
nameserver 10.10.10.20
```

3) Para restaurar los cambios efectuados en el resolv.conf ejecutaré el comando “**sudo mv etc/resolv.conf.back /etc/resolv.conf**”

2.FIERCE:

1) Ejecutamos el “fierce –help”:

```
options:
-h, --help            show this help message and exit
--domain DOMAIN       domain name to test
--connect             attempt HTTP connection to non-RFC 1918 hosts
--wide               scan entire class c of discovered records
--traverse TRAVERSE   scan IPs near discovered records, this won't enter ad
jacent class c's
--search SEARCH [SEARCH ...]
                    filter on these domains when expanding lookup
--range RANGE         scan an internal IP range, use cidr notation
--delay DELAY         time to wait between lookups
--subdomains SUBDOMAINS [SUBDOMAINS ...]
                    use these subdomains
--subdomain-file SUBDOMAIN_FILE
                    use subdomains specified in this file (one per line)
--dns-servers DNS_SERVERS [DNS_SERVERS ...]
                    use these dns servers for reverse lookups
--dns-file DNS_FILE   use dns servers specified in this file for reverse lo
okups (one per line)
--tcp                use TCP instead of UDP
```

2) Ejecutamos “fierce –domain [Nombre de dominio]” en nuestro caso, Google.com para hacer un ataque básico por diccionario:

```
(izan@kali)-[~]
$ sudo fierce --domain ceti.local
NS: ubuntu1rv.ceti.local.
SOA: ubuntu1rv.ceti.local. (10.10.10.20)
Zone: success
{<DNS name @>: '@ 604800 IN SOA ubuntu1rv root 3 604800 86400 2419200 604800\
n'
  '@ 604800 IN NS ubuntu1rv',
  <DNS name ceo>: 'ceo 604800 IN A 10.10.10.4',
  <DNS name clase>: 'clase 604800 IN A 193.54.21.1',
  <DNS name consultor>: 'consultor 3600 IN CNAME ceo',
  <DNS name correo>: 'correo 604800 IN A 10.10.10.44',
  <DNS name dns>: 'dns 604800 IN A 10.10.10.33',
  <DNS name fsystem>: 'fsystem 604800 IN A 10.10.10.40',
  <DNS name ftp>: 'ftp 604800 IN A 10.10.10.69',
  <DNS name impresora>: 'impresora 604800 IN A 10.10.10.60',
  <DNS name mercedes>: 'mercedes 604800 IN A 35.157.228.228',
  <DNS name mx1>: 'mx1 604800 IN MX 10 10.10.10.99',
  <DNS name test>: 'test 604800 IN SRV 10 100 5060 ceo',
  <DNS name ubuntu1rv>: 'ubuntu1rv 604800 IN A 10.10.10.20',
  <DNS name xirivella>: 'xirivella 604800 IN A 10.10.10.89',
  <DNS name zaragoza>: 'zaragoza 604800 IN A 10.10.10.88'}
```

3) Ejecutamos “fierce –domain [ejemplo.com] –subdomain-file [ip_server]” para especificar un archivo con dns.

```
(izan@kali)-[~]
$ sudo fierce --domain ceti.local --subdomain-file diccionarioIzan.txt
[sudo] password for izan:
NS: ubuntusrv.ceti.local.
SOA: ubuntusrv.ceti.local. (10.10.10.20)
Zone: success
{<DNS name @>: '@ 604800 IN SOA ubuntusrv root 3 604800 86400 2419200 604800\
n'
  '@ 604800 IN NS ubuntusrv',
  <DNS name ceo>: 'ceo 604800 IN A 10.10.10.4',
  <DNS name clase>: 'clase 604800 IN A 193.54.21.1',
  <DNS name consultor>: 'consultor 3600 IN CNAME ceo',
  <DNS name correo>: 'correo 604800 IN A 10.10.10.44',
  <DNS name dns>: 'dns 604800 IN A 10.10.10.33',
  <DNS name fsystem>: 'fsystem 604800 IN A 10.10.10.40',
  <DNS name ftp>: 'ftp 604800 IN A 10.10.10.69',
  <DNS name impresora>: 'impresora 604800 IN A 10.10.10.60',
  <DNS name mercedes>: 'mercedes 604800 IN A 35.157.228.228',
  <DNS name mx1>: 'mx1 604800 IN MX 10 10.10.10.99',
  <DNS name test>: 'test 604800 IN SRV 10 100 5060 ceo',
  <DNS name ubuntusrv>: 'ubuntusrv 604800 IN A 10.10.10.20',
  <DNS name xirivella>: 'xirivella 604800 IN A 10.10.10.89',
  <DNS name zaragoza>: 'zaragoza 604800 IN A 10.10.10.88'}
```

3.DNSRECON:

1) Usamos el comando “dnsrecon – help”:

```
options:
-h, --help            show this help message and exit
-d, --domain DOMAIN   Target domain.
-n, --name_server NS_SERVER
                        Domain server to use. If none is given, the SOA of the target will be used. Multiple s
ervers can be specified using a comma separated list.
-r, --range RANGE      IP range for reverse lookup brute force in formats (first-last) or in (range/bitmask
).
-D, --dictionary DICTIONARY
                        Dictionary file of subdomain and hostnames to use for brute force.
-f                     Filter out of brute force domain lookup, records that resolve to the wildcard defined
IP address when saving records.
-a                     Perform AXFR with standard enumeration.
-s                     Perform a reverse lookup of IPv4 ranges in the SPF record with standard enumeration.
-b                     Perform Bing enumeration with standard enumeration.
-y                     Perform Vandex enumeration with standard enumeration.
-k                     Perform crt.sh enumeration with standard enumeration.
-w                     Perform deep whois record analysis and reverse lookup of IP ranges found through Whois
when doing a standard enumeration.
-z                     Performs a DNSSEC zone walk with standard enumeration.
--threads THREADS      Number of threads to use in reverse lookups, forward lookups, brute force and SRV reco
rd enumeration.
--lifetime LIFETIME     Time to wait for a server to respond to a query. default is 3.0
--tcp                  Use TCP protocol to make queries.
--db DB                SQLite 3 file to save found records.
-x, --xml XML           XML file to save found records.
-c, --csv CSV           Save output to a comma separated value file.
-j, --json JSON         save output to a JSON file.
-iw                   Continue brute forcing a domain even if a wildcard record is discovered.
--disable_check_recursion
                        Disables check for recursion on name servers
--disable_check_bindversion
                        Disables check for BIND version on name servers
-V, --version           Show DNSrecon version
-v, --verbose           Enable verbose
-t, --type TYPE         Type of enumeration to perform.
                        Possible types:
                        std:      SOA, NS, A, AAAA, MX and SRV.
                        rvl:      Reverse lookup of a given CIDR or IP range.
                        brt:      Brute force domains and hosts using a given dictionary.
```

2) Ejecutamos el comando “dnsrecon -d ceti.local -n 10.10.10.20 -t brt” para realizar un ataque de fuerza bruta sin usar directorio personalizado.

```
(izan@kali)-[~]
$ dnsrecon -d ceti.local -n 10.10.10.20 -t brt
[*] No dictionary file has been specified.
[*] Using the dictionary file: /usr/share/dnsrecon/dnsrecon/data/namelist.txt (provided by tool)
[*] brt: Performing host and subdomain brute force against ceti.local...
[+] A correo.ceti.local 10.10.10.44
[+] A dns.ceti.local 10.10.10.33
[+] A ftp.ceti.local 10.10.10.69
[+] 3 Records Found
```

3) Ejecutamos el comando “dnsrecon -d ceti.local -n 10.10.10.20 -t brt -D (diccionario.ej)” para realizar un ataque de fuerza bruta a un directorio personalizado.

```
(izan@kali)-[~]
$ dnsrecon -d ceti.local -n 10.10.10.20 -t brt -D diccionarioIzan.txt
[*] Using the dictionary file: diccionarioIzan.txt (provided by user)
[*] brt: Performing host and subdomain brute force against ceti.local...
[+] A fsystem.ceti.local 10.10.10.40
[+] 1 Records Found
```

4) Ejecutamos el comando “dnsrecon -d ceti.local -n 10.10.10.20 -t brt --json /home/kali/resultados.json” para guardar los resultados del ataque en un fichero .json “resultados”:

```
(izan@kali)-[~]
$ dnsrecon -d ceti.local -n 10.10.10.20 -t brt --json /home/kali/Desktop/resultados.json
[*] No dictionary file has been specified.
[*] Using the dictionary file: /usr/share/dnsrecon/dnsrecon/data/namelist.txt (provided by tool)
[*] brt: Performing host and subdomain brute force against ceti.local...
[+] A correo.ceti.local 10.10.10.44
[+] A dns.ceti.local 10.10.10.33
[+] A ftp.ceti.local 10.10.10.69
[+] 3 Records Found
[*] Saving records to JSON file: /home/kali/Desktop/resultados.json
(izan@kali)-[~]
```

4.DNSENUM:

1) Usamos el comando “dnsenum -help”:

```
GENERAL OPTIONS:
--dnsserver <server>      Use this DNS server for A, NS and MX queries.
--enum                    Shortcut option equivalent to --threads 5 -s 15 -w.
-h, --help                Print this help message.
--noreverse               Skip the reverse lookup operations.
--nocolor                 Disable ANSIColor output.
--private                 Show and save private ips at the end of the file domain_ips.txt
.
--subfile <file>          Write all valid subdomains to this file.
-t, --timeout <value>    The tcp and udp timeout values in seconds (default: 10s).
--threads <value>        The number of threads that will perform different queries.
-v, --verbose             Be verbose: show all the progress and all the error messages.
GOOGLE SCRAPING OPTIONS:
-p, --pages <value>      The number of google search pages to process when scraping name
s,
                           the default is 5 pages, the -s switch must be specified.
-s, --scrap <value>      The maximum number of subdomains that will be scraped from Goog
le (default 15).
BRUTE FORCE OPTIONS:
-f, --file <file>        Read subdomains from this file to perform brute force. (Takes p
riority over default dns.txt)
-u, --update <alg|rlz>
```

2) Ejecutamos “dnstool --dnsserver 10.10.10.20 ceti.local” para poder hacer un ataque sin diccionario personalizado.

```
Name Servers:
-----
ubuntusrv.ceti.local.          604800  IN      A       10.10.10.20

ceo.ceti.local.       604800  IN      A        10.10.10.4
clase.ceti.local.     604800  IN      A        193.54.21.1
consultor.ceti.local. 3600    IN      CNAME    ceo.ceti.local.
correo.ceti.local.    604800  IN      A        10.10.10.44
dns.ceti.local.       604800  IN      A        10.10.10.33
fsystem.ceti.local.   604800  IN      A        10.10.10.40
ftp.ceti.local.       604800  IN      A        10.10.10.69
impresora.ceti.local. 604800  IN      A        10.10.10.60
mercedes.ceti.local.  604800  IN      A        35.157.228.228
mx1.ceti.local.       604800  IN      MX       10
test.ceti.local.      604800  IN      SRV      10
ubuntusrv.ceti.local. 604800  IN      A        10.10.10.20
xirivella.ceti.local. 604800  IN      A        10.10.10.89
zaragoza.ceti.local.  604800  IN      A        10.10.10.88

Brute forcing with diccionarioIzan.txt:
-----

ceti.local class C netranges:
-----

35.157.228.0/24
193.54.21.0/24

Performing reverse lookup on 512 ip addresses:
-----

0 results out of 512 IP addresses.
```

5. THE HARVESTER:

1) Ejecutamos el comando `theHarvester -help` y nos salen todas estas opciones:

```
-h, --help                show this help message and exit
-d, --domain DOMAIN       Company name or domain to search.
-l, --limit LIMIT         Limit the number of search results, default=500.
-S, --start START         Start with result number X, default=0.
-p, --proxies             Use proxies for requests, enter proxies in proxies.yaml.
-s, --shodan             Use Shodan to query discovered hosts.
--screenshot SCREENSHOT  Take screenshots of resolved domains specify output
                        directory: --screenshot output_directory
-v, --virtual-host        Verify host name via DNS resolution and search for virtual
                        hosts.
-e, --dns-server DNS_SERVER
                        DNS server to use for lookup.
-t, --take-over           Check for takeovers.
-r, --dns-resolve [DNS_RESOLVE]
                        Perform DNS resolution on subdomains with a resolver list or
                        passed in resolvers, default False.
-n, --dns-lookup         Enable DNS server lookup, default False.
-c, --dns-brute          Perform a DNS brute force on the domain.
-f, --filename FILENAME  Save the results to an XML and JSON file.
-w, --wordlist WORDLIST  Specify a wordlist for API endpoint scanning.
-a, --api-scan           Scan for API endpoints.
-q, --quiet             Suppress missing API key warnings.
-b, --source SOURCE      baidu, bevigil, bing, bingapi, brave, bufferoverrun,
                        builtwith, censys, certspotter, criminalip, crtsh, dehashed,
                        dnsdumpster, duckduckgo, fullhunt, github-code, hackertarget,
                        haveibeenpwned, hunterhow, intelx, leaklookup,
```

2) Usaremos el comando “theHarvester -d ceti.local -b dns -n 10.10.10.20” para usar la función de búsqueda por fuerza bruta con nuestro dns (q dará error).

```
(izanz@kali)-[~]
$ theHarvester -d ceti.local -b dns -n 10.10.10.20

7. AMASS:

1) Descargamos e instalamos la última versión reconocida en el repositorio de Github:

```
(izan@kali)-[~/Downloads]
$ ls
amass-5.0.1  amass-5.0.1.zip

(izan@kali)-[~/Downloads]
$ sudo mv amass-5.0.1 /usr/local/bin
[sudo] password for izan:

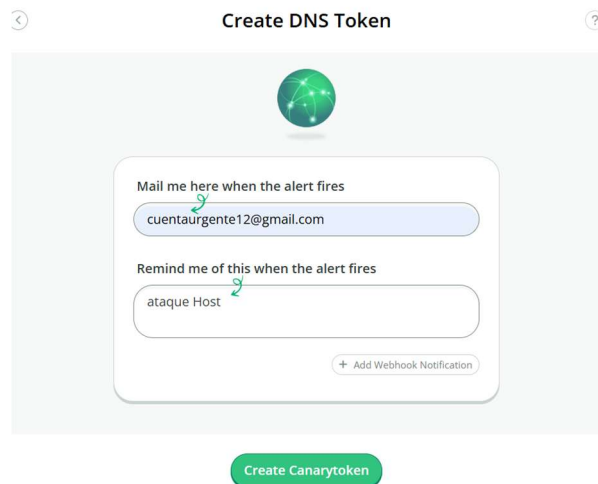

(izan@kali)-[~/Downloads]
$
```

2) Realiza: Enumeración de subdominios con fuerza bruta. Pero sin resultados ya que no encuentra nada con nuestro servidor 10.10.10.20

```
(izan@kali)-[~/Downloads]
$ sudo amass enum -v -brute -d ceti.local -r 10.10.10.20,8.8.8.8

8.CANARY:

1) Entramos en el enlace de <https://canarytokens.org/nest/> y sacamos el token canary

Canarytoken hostname

d4vm7qrpoxof39e65ae1t021vb.canarytokens.com

Remember, it gets triggered whenever someone performs a DNS lookup of the hostname. [Need more tips?](#)

2) Añadimos la siguiente información dentro del UbuntuServer (Ultima línea) poniendo el token proporcionado por canary.

```
GNU nano 7.2 /etc/bind/zones/db.ceti.local
$TTL 604800
; SOA record with MNAME and RNAME updated
@      IN      SOA      ubuntu.ubuntu. (
                        3      ; Serial Note: increment after each change
                        604800 ; Refresh
                        86400  ; Retry
                        2419200 ; Expire
                        604800 ) ; Negative Cache TTL
; Name server record
@      IN      NS      ubuntu.ubuntu.
; A record for name server
ubuntu IN      A       10.10.10.20
; A record for clients
impresora IN      A       10.10.10.60
ceo      IN      A       10.10.10.4
fsystem  IN      A       10.10.10.40
correo   IN      A       10.10.10.44
ftp      IN      A       10.10.10.69
dns      IN      A       10.10.10.33
test     SRV      10 100 5060 ceo.ceti.local.
mx1      IN      MX      10 10.10.10.99
consultor 3600    IN      CNAME ceo.ceti.local.
zaragoza IN      A       10.10.10.88
xirivella IN      A       10.10.10.89
mercedes IN      A       35.157.228.228
clase    IN      A       193.54.21.1
windows  IN      CNAME    murv1wqinbnus90dqqjnj2u1n.canarytokens.com
```

3) Hacemos un Reload al bind del Ubuntu Server para guardar los cambios y así poder comprobarlo desde nuestra VM Kali.

```
root@ubuntusrv:~# sudo systemctl reload bind9
root@ubuntusrv:~# dig @10.10.10.20 windows.ceti.local CNAME +short
mwrw1wqinbnus90dqgjnq2uln.canarytokens.com.ceti.local.
```

4) Dentro de Kali hacemos “dig Windows.ceti.local” y nos mostrará la última línea introducido al UbuntuServer con los cambios.

```
(izan@kali)~$ dig windows.ceti.local
